## **Problem Statement**

Every 40 seconds, a child in India goes missing or is abducted. Of the thousands of people who go missing in India each year, especially tragic is the disappearance of the young and vulnerable. According to the CBI and Indian Police, there are 85,459 active missing person records, of which juveniles under the age of 18 accounted for 29,758 (34.8%) as of December 31, 2018.

## **Proposed Solution**

KHOJ will help to find a missing person. The guardian of the missing person will upload the details of that person, so the image will be added in the KHOJ database.

The cameras installed in the city can use Person Re-Identification Technology, to identify the missing person. Also if any person finds a person which was missing, he can also upload the picture of that person through KHOJ. In both the cases KHOJ will try to find that person in the database, and if found it will notify the nearest police station from where the person is found and the guardian of the missing person.

## **Introduction**

On average, a child goes missing every 10 minutes in India, according to the women and child development ministry website for tracking missing children. At this rate, around 54,750 children would have been reported missing in the last one year in India and only about half of them would have been traced, if one goes by the police record on the missing children.

This startling data could be considered nemesis of the mob lynching incidents over suspicion of the child lifting gangs in the Hindi heartland, which has high incidence of children going missing for a population of one lakh than other parts of India. India is home to more than 400 million children below the age of 18 years, and is considered one of the countries in which youth and children comprise more than 55% of the population. These missing children represent diverse cultures, religions, castes, communities, social and economic groups.

Our solution is targeted at helping the law and law keepers with their job to find these missing children. We also aim at providing the local public with a tool to reach out to the police easily and register their complaint at the earliest. Our database is made to store all the images from various entries provided by our users and then the face recognition model uses the inputs to identify the missing ones.

There are already a very large number of cameras installed at various public spots. These cameras are targeted at catching the vehicles and identify the number plates for issuing fines, etc. The same feed from these cameras can be used to fetch the database.

Khoj is one means of cutting short the long procedure of registering the complaint and then getting the work started. The aim of this project is to design a system which can start working as soon as the complaint is registered. Another objective identified under this project targets to allow the general public to reach the police or help, if in case they find someone who was initially missing. This can actually lower the load of searching by the police. We shall be providing an option for the police to manage the requests and attend to the complaints easily and all at a place.

## Methodology

The project targeted the use of many new technologies and their implementation. It is divided into two modules. Initial phase aims at creating a registration form for the user via which they can register a complaint or convey a message to the police. Then, we implement a face-recognition system which treats the uploaded data as an input case, records it, registers it and then starts parsing.

### When a person is lost:

The guardian can upload the details onto the platform via means of a form submission.

The image shows a web form titled "KHOJ" with the subtitle "A platform to prevent child trafficking." The form contains several input fields and dropdown menus for user details: First Name, Last Name, Gender (with a dropdown menu showing "Male"), Blood Group, Face Complexion (with a dropdown menu showing "Wheatish"), Body Build (with a dropdown menu showing "Thin"), Min Height Range (with a dropdown menu showing "In centimetres"), Max Height Range (with a dropdown menu showing "In centimetres"), Aadhar Card Number (with a placeholder "Enter Aadhar Card Number"), Face Shape (with a dropdown menu showing "Oval"), and a field for "Enter Last Location Before Disappearance" (with a dropdown menu showing "Andhra Pradesh"). Below these fields is a section for uploading images, with the text "Upload the images of the lost person", a "Browse..." button, and a status "No files selected." at the bottom is an "Upload" button.

When the missing person is found by someone, but they don't know the credentials, the user can simply upload the person's image. The uploaded image will be matched in for face recognition, if found, the required details will be sent to the nearest police station.

### When the missing person is found by someone:

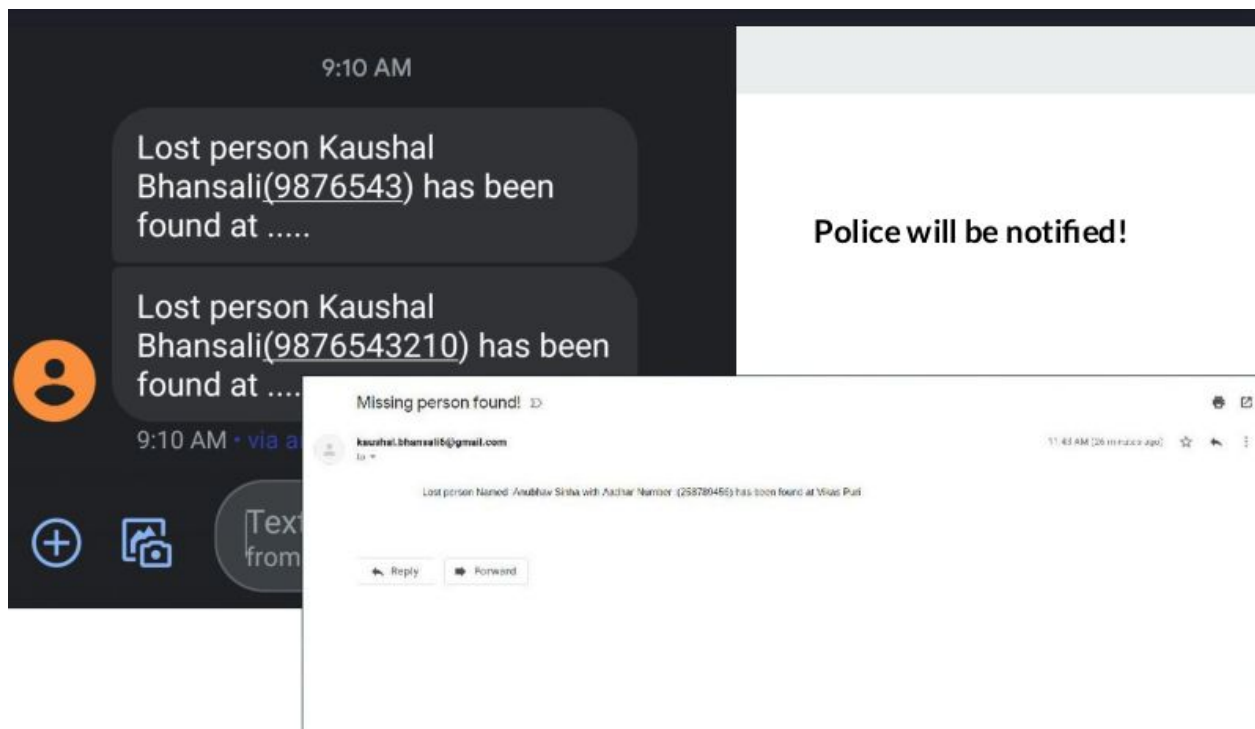

The images of the person will be searched in the KHOJ database, if found the Police and Guardian will be notified.

The option to upload the image will be made available to the common user to upload the photos of the one's found alone or missing.

The screenshot displays the KHOJ web interface. At the top, the word "KHOJ" is prominently displayed in a large, bold, sans-serif font. Below it, a subtitle reads "A platform to prevent child trafficking." The main content area features a form for uploading information about a found person. The form includes a section titled "Upload image of the found person" with a "Browse..." button and the text "No files selected." Below this is a section titled "Enter Location of Current Find" with a dropdown menu currently showing "Ambedkar Nagar" and a blue "Upload" button.

Police or any person in authority will be contacted immediately as and when the model detects a similarity.

**Role of Police:** When the nearest police station will be notified, the police have to make the surveillance high at that area where the person was found through the cameras installed in the cities. In this way the person who has found the missing person can not ask for any money from the guardian for the return of that missing person.

Submit Found Entry

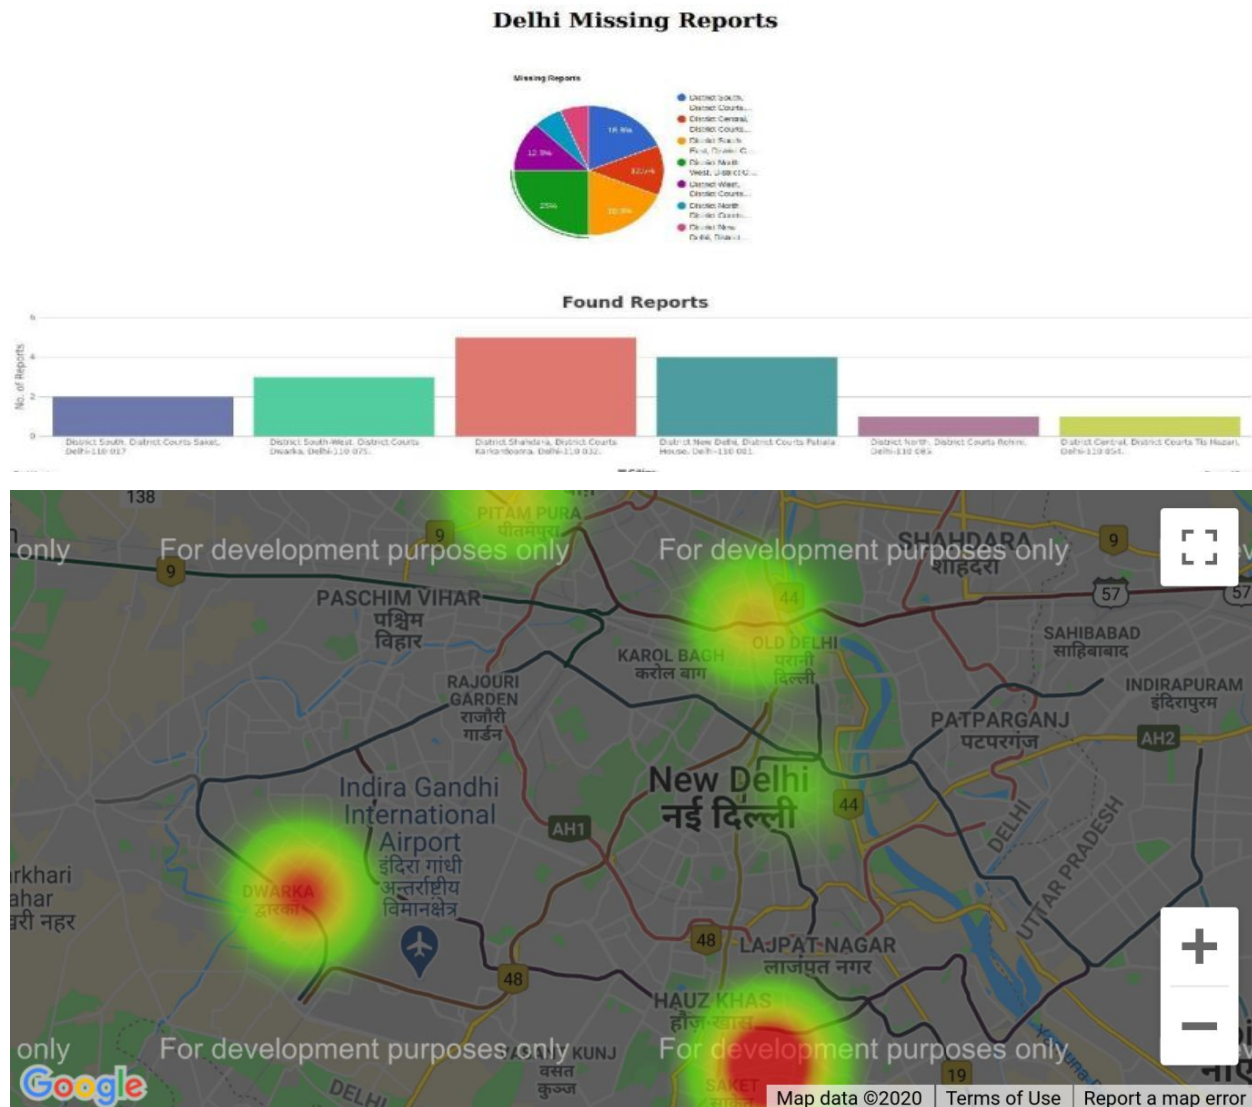

Submit Missing Entry

View Data Charts

View Heat Map

**Benefits for Police:** Police will be able to visualize the data, and track from which area maximum people are missing. And also he will be able to know where maximum people are being found. Also a heat map is being generated which will help the police to trace the locations from where the maximum lost reports are being found.

Police will also be able to upload the picture of the unidentified dead bodies to match them with the current database of the missing person.

## Technology Used:

Table 1: Technologies Used

Purpose	Technologies Used
Backend Support	Django, Python, OpenCV
Frontend Designing	Bootstrap, HTML5, Jinja2, Javascript
Continuous Integration	Travis CI
Continuous Deployment	Heroku, Docker
Monitoring	Jira
Communication	Discord
Testing	Unittest, Selenium

## Team and Roles:

Table 2: Team and Roles assigned

Name	Role
Kaushal Bhansali (17103299)	Backend Engineer
Anubhav Sinha (17103135)	Backend Engineer
Piyush Gupta (17103067)	Frontend Engineer
Astitva Singhal (17103136)	Software Tester
Aman Khare (17103048)	Software Tester
Siddharth Batra (17103070)	Devops Engineer
Chitransh Mishra (17103103)	Scrum Master

## Jira Snapshots:

Jira is a proprietary issue tracking product developed by Atlassian that allows bug tracking and agile project management.

We have used Jira by Atlassian Software for creating the user stories and to plan the sprint for the project. Following are snapshots showing the user stories implemented:

Table 1: User stories

S. No.	Description	Priority
DP-27	As a user, I want to add details of the missing person so that everyone is able to see the details of the missing person.	<b>Highest</b>
DP-28	As a user, I should be able to upload pictures with location, and contact nearest police station, so that I can report if I spotted a lost person.	<b>Highest</b>
DP-29	As a user(police), I want to login into the analytics dashboard, so that I can see the trends where the mishappenings occur the most.	<b>Medium</b>
DP-30	As a user(police), I want to view the analytics of the missing and found cases in my city so that I can write reports and enable investigations	<b>Medium</b>
DP-31	As a user(admin), I want to have the access of the database, so that I can manipulate it if needed.	<b>Low</b>
DP-32	As a user(police), I should be able to receive contact details of the person who has reported details of a missing person so that police can verify the report to be genuine by contacting the reportee.	<b>High</b>
DP-33	As a user(police), I want to get the real time tracking of a criminal person in any large gathering so that, it is easier for the police to catch.	<b>Medium</b>
DP-34	As a user(police), I should be able to get lost and found	<b>High</b>

	details only from credible users so that there are no false positives or negatives.	
DP-35	As a user, I want to see the status of my application so that I can determine if appropriate actions are underway	Medium
DP-36	As a user, I want to upload more photos at a later stage of report so that it is useful for finding the person in a better way.	High
DP-37	As a user, I should be able to file the FIR of the missing person.	Highest
DP-38	As a user, I should be able to file bugs in the website so that it can be fixed at the server side.	Lowest
DP-39	As a user, I want an option to delete my complaint so that I can withdraw a report in case of any person found thereafter	Medium

Sprint 1: 15 Oct 2020 - 27 Nov 2020

Objective: Complete all the high priority objectives

Issues Completed:

### Burndown Chart:

## Planning Poker Snapshots:

Planning poker is a consensus-based, gamified technique for estimating, mostly used to estimate effort or relative size of development goals in software development. In planning poker, members of the group make estimates by playing numbered cards face-down to the table, instead of speaking them aloud. The cards are revealed, and the estimates are then discussed. By hiding the figures in this way, the group can avoid the cognitive bias of anchoring, where the first number spoken aloud sets a precedent for subsequent estimates.

### Pulling in for User stories:

The top screenshot shows a game in progress on the planningpoker.com website. The user story being estimated is: "As a user, I should be able to upload pictures with location, and contact nearest police station, so that I can report if I spotted a lost person." The score is 3/12. The cards shown are 3, 5, 3, and 2. The bottom screenshot shows the same game with a different user story: "As a user, I want to see the status of my application so that I can determine if appropriate actions are underway." The score is 12/12. The cards shown are 3, 2, 3, 3, and 5. Both screenshots show a deck of numbered cards and a list of user stories on the right.

**Top Screenshot:**

URL: <https://play.planningpoker.com/play/game/IM3VKaCBjYVn98QNP9XjbfduGVb0to>

User Story: As a user, I should be able to upload pictures with location, and contact nearest police station, so that I can report if I spotted a lost person.

Score: 3/12

Cards: 3, 5, 3, 2

**Bottom Screenshot:**

For creating the CI/CD pipeline, we are using the integration of Travis CI and Heroku, Travis CI is helping us to do the CI and post successful CI the web app will be deployed on Heroku.

## Travis CI Configuration:

Allowing Travis CI for the Khoj-Devops repository, so that Travis can do the CI whenever a new pull request is triggered and a pull request is merged post code review.

### Legacy Services Integration

### General

- ☒ Build pushed branches 
- ☒ Build pushed pull requests 
- ☐ Limit concurrent jobs 

### Auto Cancellation

Auto Cancellation allows you to only run builds for the latest commits in the queue. This setting can be applied to builds for Branch builds and Pull Request builds separately. Builds will only be canceled if they are waiting to run, allowing for any running jobs to finish.

- ☒ Auto cancel branch builds
- ☒ Auto cancel pull request builds

### Environment Variables

Customize your build using environment variables. For secure tips on generating private keys read our [documentation](#)

 If your secret variable has special characters like `&`, escape them by adding `\` in front of each special character. For example, `ma&w!doc` would be entered as `ma\&w!doc`.

NAME	VALUE	BRANCH	
<input type="text" value="Name"/>	<input type="text" value="Value"/>	<input type="text" value="All branches"/>	<input type="checkbox"/> DISPLAY VALUE IN BUILD LOG <input type="button" value="Add"/>

## A webhook is added to the GitHub repo -

### Webhooks

Webhooks allow external services to be notified when certain events happen. When the specified events happen, we'll send a POST request to each of the URLs you provide. Learn more in our [Webhooks Guide](#).

We will also send events from this repository to your [organization webhooks](#).

✓ <https://notify.travis-ci.org/> (create, delete, issue\_comm...)

## Deployment on Heroku -

We have connected the GitHub repo to the Heroku for the deployment, and then we have enabled the option such that when the Travis test passes only then new version should be deployed, and we have also enabled Automatic Deploys option, which will deploy the latest code immediately once the CI passes.

Automatic deploys

Enables a chosen branch to be automatically deployed to this app.

You can now change your main deploy branch from "master" to "main" for both manual and automatic deploys, please follow the instructions [here](#).

Automatic deploys from `master` are enabled

Every push to `master` will deploy a new version of this app. **Deploys happen automatically**; be sure that this branch in GitHub is always in a deployable state and any tests have passed before you push. [Learn more](#)

☒ Wait for CI to pass before deploy  
Only enable this option if you have a Continuous Integration service configured on your repo.

[Disable Automatic Deploys](#)

---

Manual deploy

Deploy the current state of a branch to this app.

Deploy a GitHub branch

This will deploy the current state of the branch you specify below. [Learn more](#)

## Testing Data:

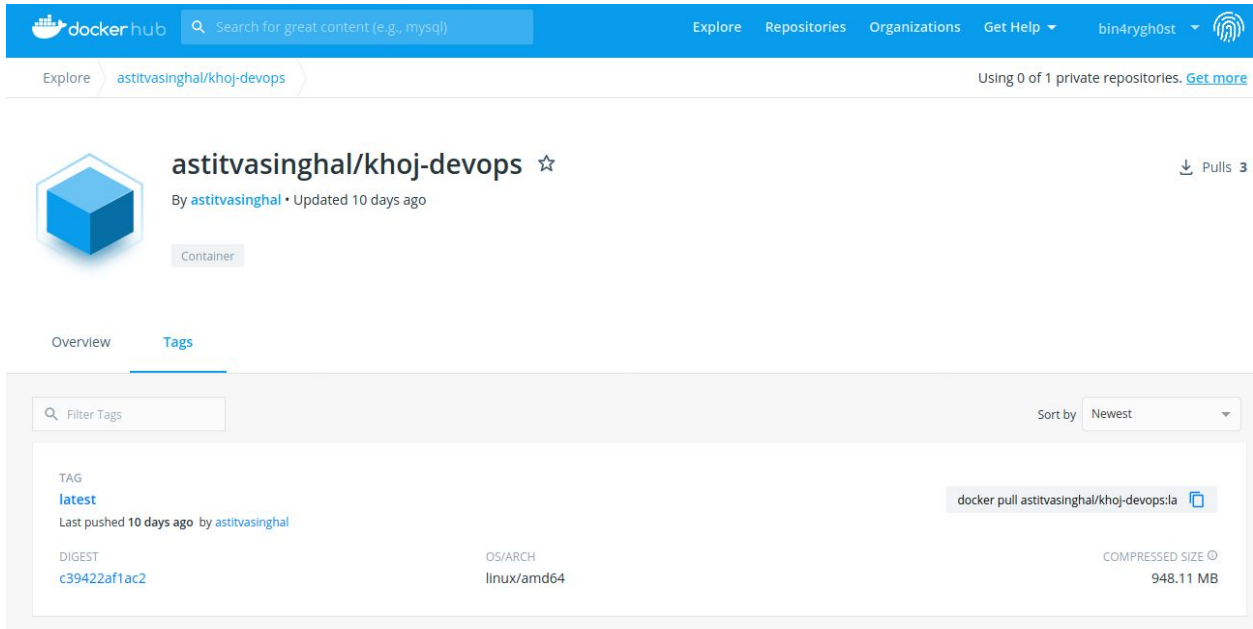

### Sample Tests -

```
import json
import unittest
import sample_test_results
from core import stats

class DjangoTestCases(unittest.TestCase):
    def test_lost_stats(self):
        self.lost_count_at_places = stats.lost_stats()
        self.assertNotEqual(self.lost_count_at_places, 0)
        self.assertNotEqual(self.lost_count_at_places, None)
        self.assertEqual(str(type(self.lost_count_at_places)), "<class 'dict'>")
        self.assertEqual(self.lost_count_at_places, sample_test_results.SAMPLE_TEST_LOST_STATS_RESULTS)

    def test_found_stats(self):
        self.found_count_at_places = stats.found_stats()
        self.assertNotEqual(self.found_count_at_places, 0)
        self.assertNotEqual(self.found_count_at_places, None)
        self.assertEqual(str(type(self.found_count_at_places)), "<class 'dict'>")
        self.assertEqual(self.found_count_at_places, sample_test_results.SAMPLE_TEST_FOUND_STATS_RESULTS)
```

## Docker image hosted on docker hub:

The screenshot shows the Docker Hub interface for the repository `astitvasinghal/khoj-devops`. The repository is owned by `astitvasinghal` and was updated 10 days ago. It is a container image. The 'Tags' tab is active, displaying a list of tags. The 'latest' tag is selected, showing details: 'Last pushed 10 days ago by astitvasinghal', 'DIGEST: c39422af1ac2', 'OS/ARCH: linux/amd64', and 'COMPRESSED SIZE: 948.11 MB'. A search bar for tags and a 'Sort by' dropdown are also visible.

<https://hub.docker.com/r/astitvasinghal/khoj-devops/>

## Github Configuration:

We made an organization on GitHub known as Future Devs and then we created a repository on it, and gave the admin access of the repo to all the users.

## Link of the GitHub Repo -

<https://github.com/future-devs/Khoj-Devops>
